

# Home page

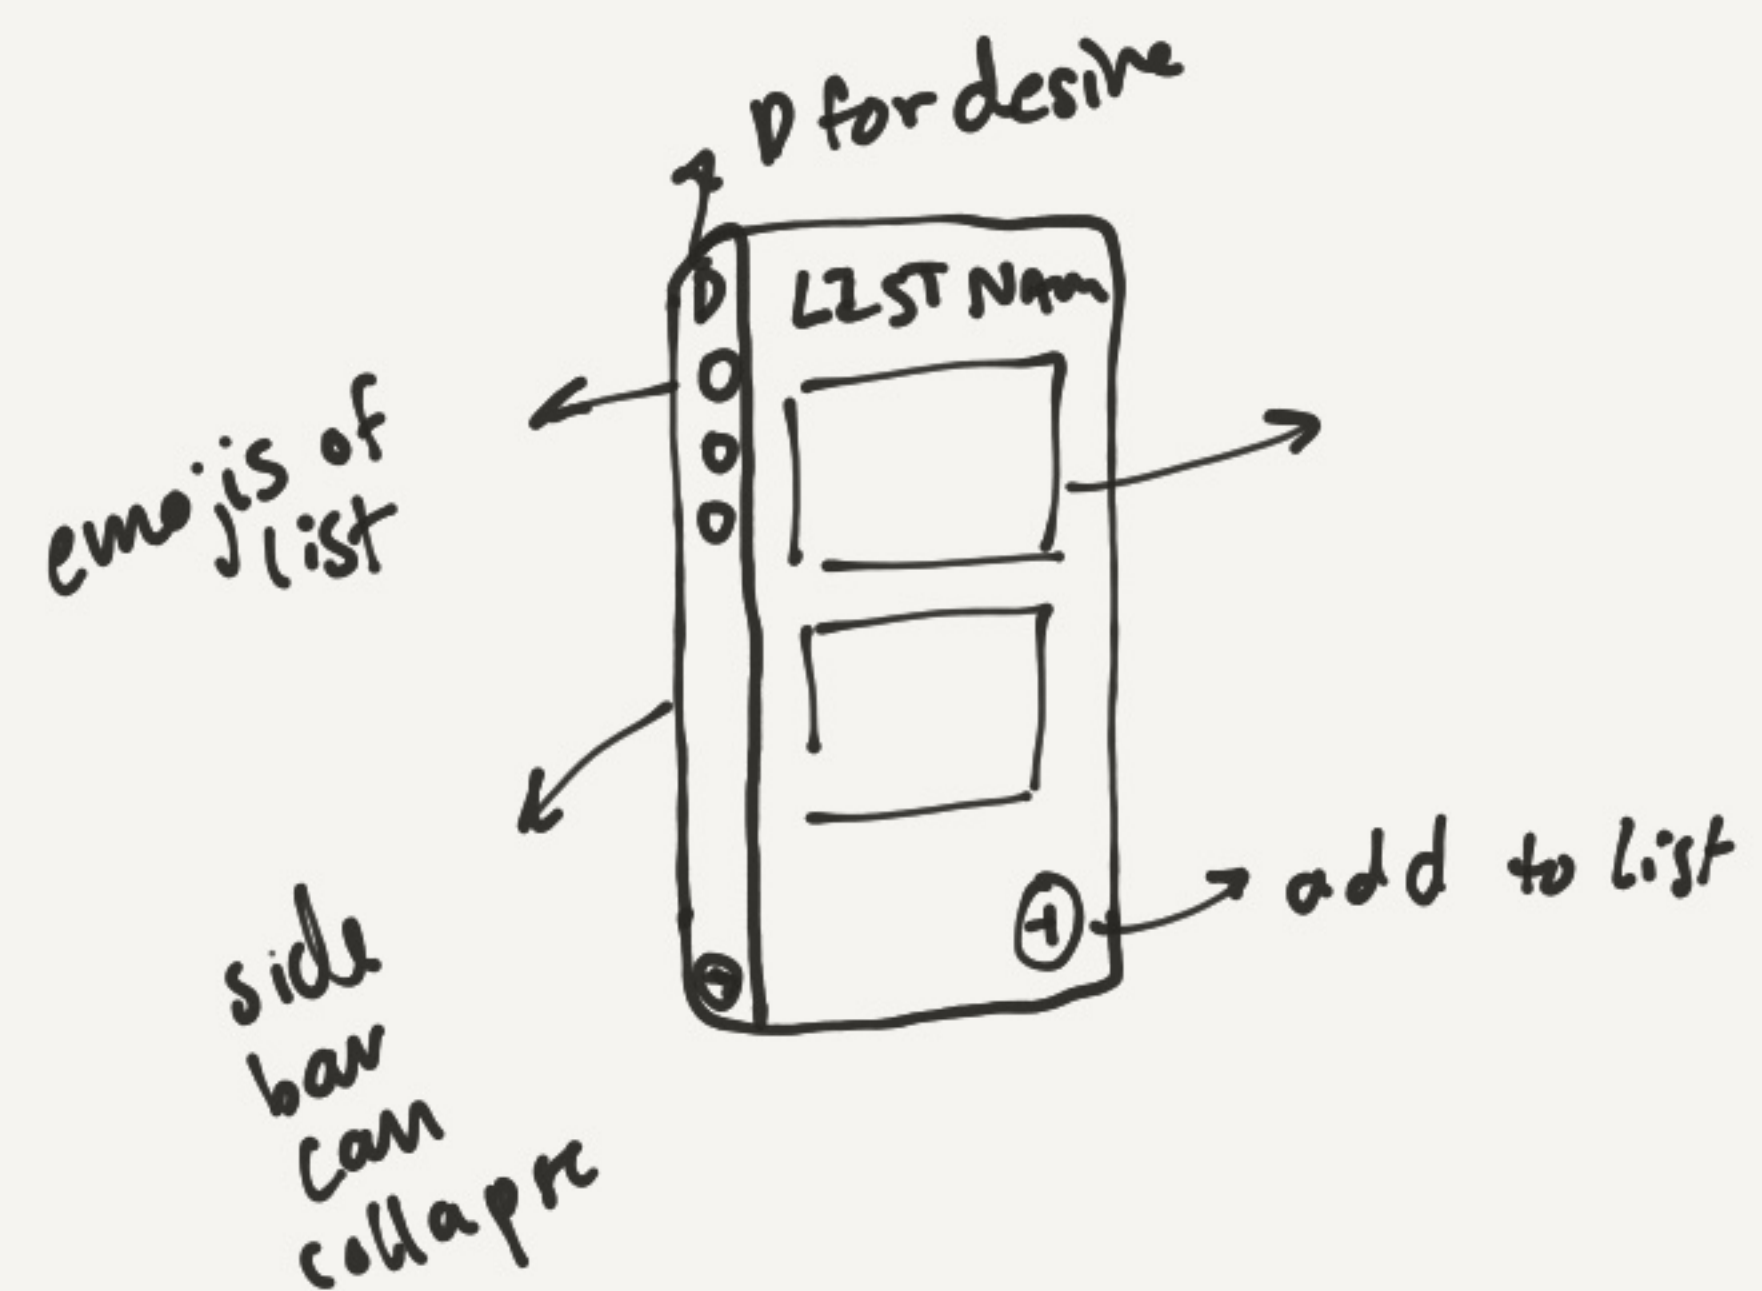

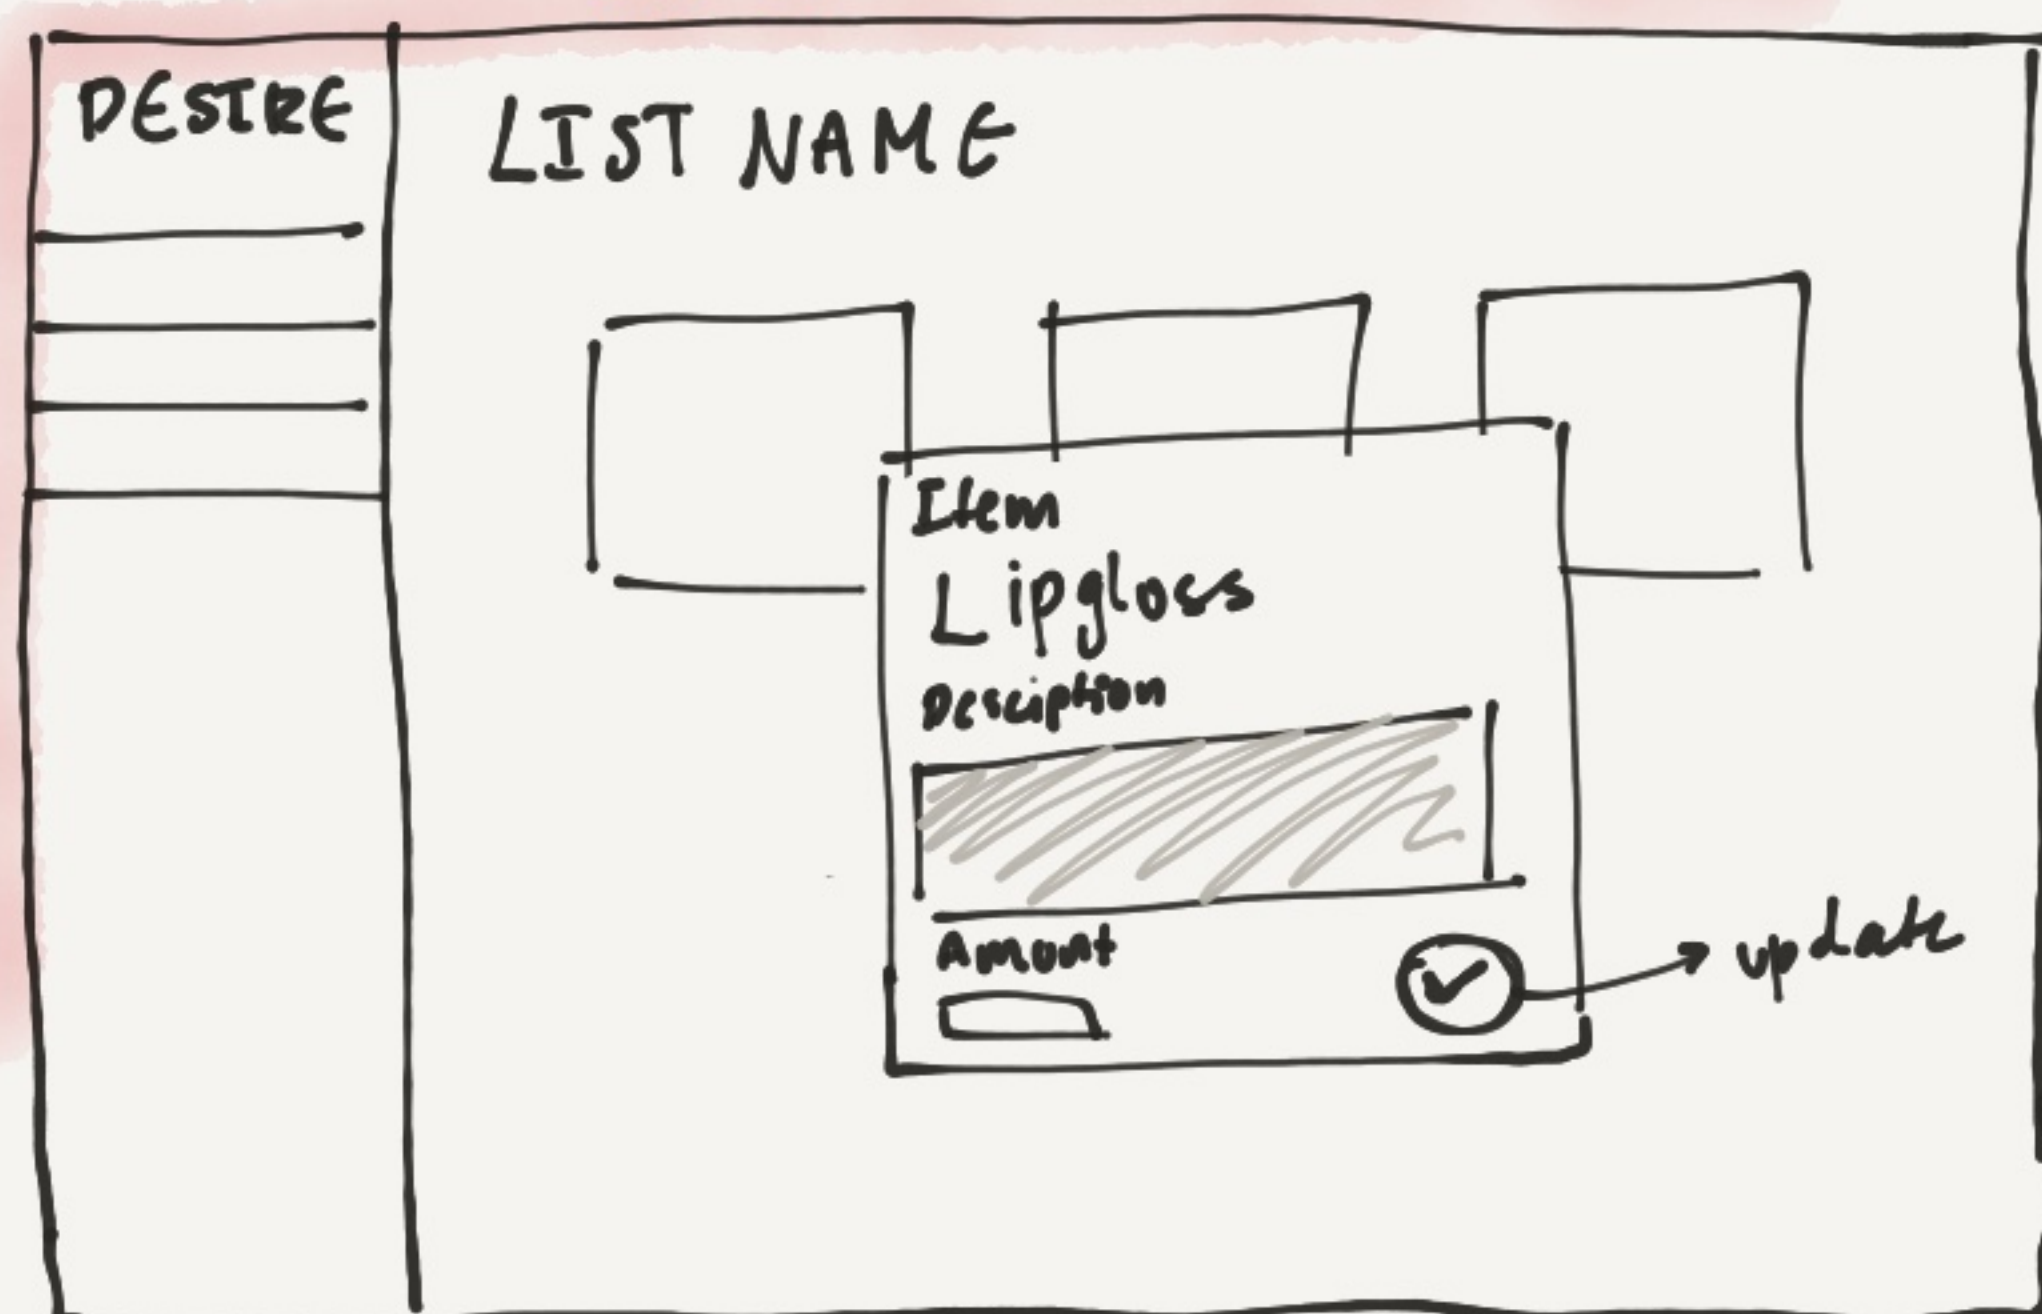

# edit to item cards:

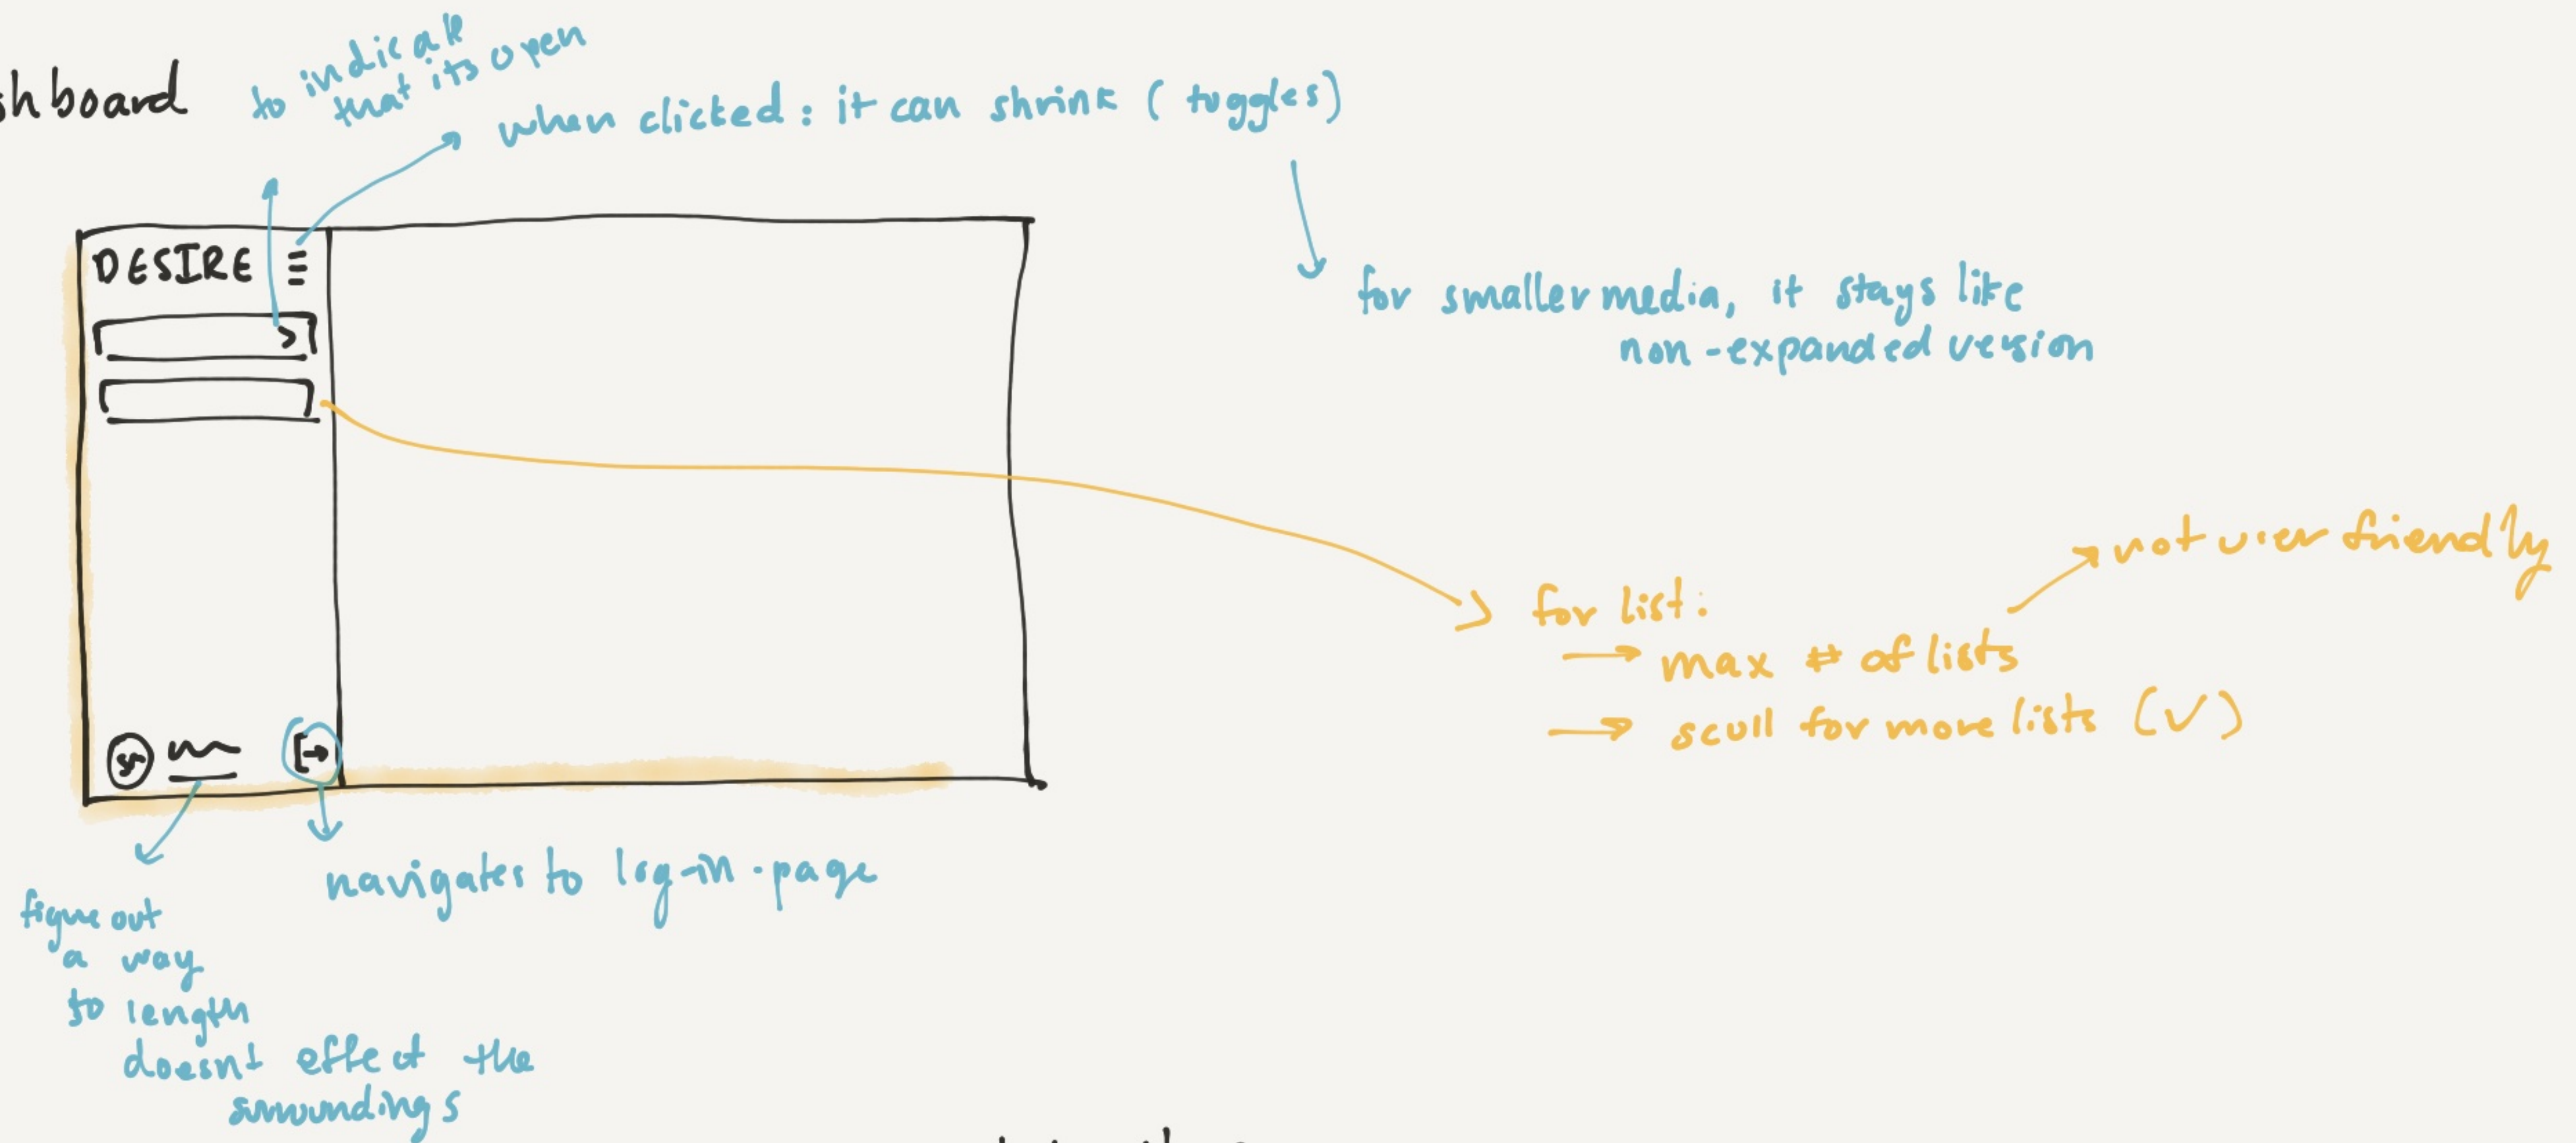

to edit.

(to add / edit an item)

Dashboard

later steps

☐ figure out why it doesn't navigate to login-page

☒ find out a way so length of email doesn't effect surroundings

☐ add the 'getinitial' function in helper.js

☒ add list components

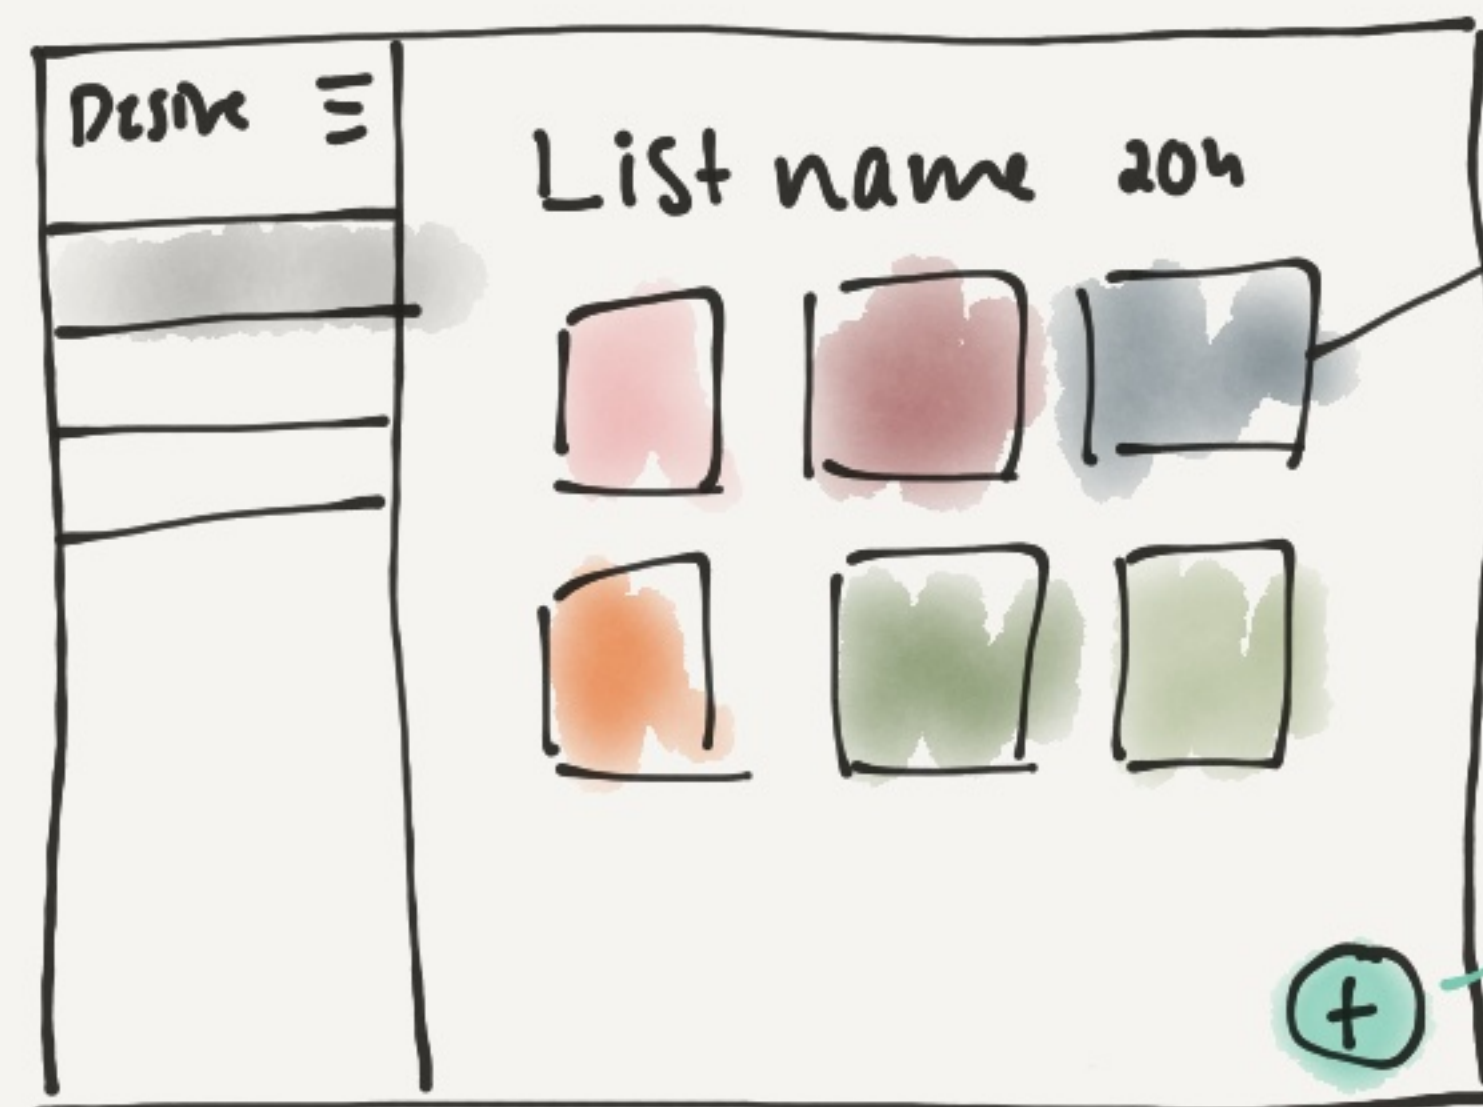

☒ sign up the  icon &  icon when not-expanded

used min-w-0 & truncate

# Item cards

next steps: turn into an app (?)

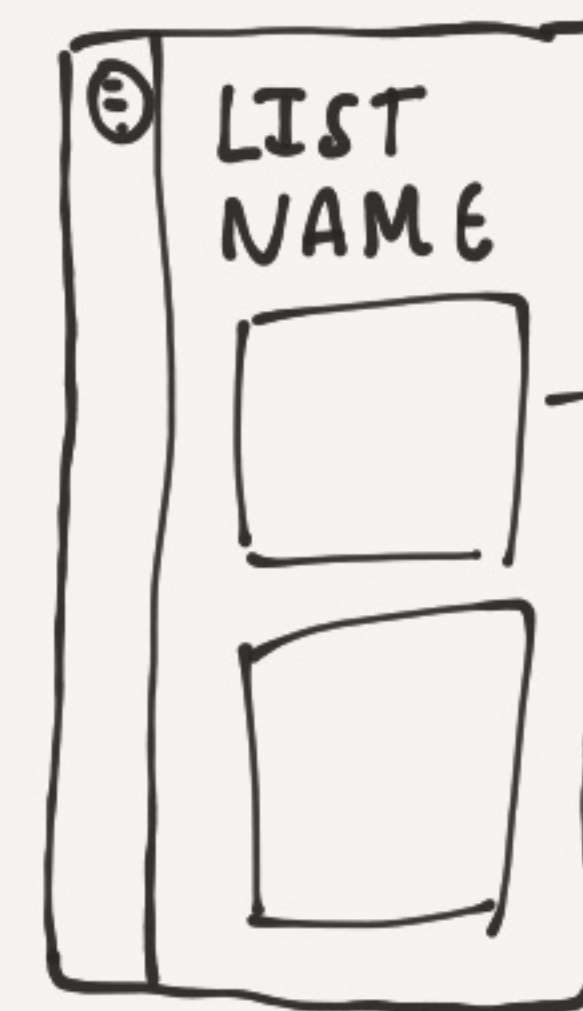

make sure these are responsible to mobile screens

add to active list

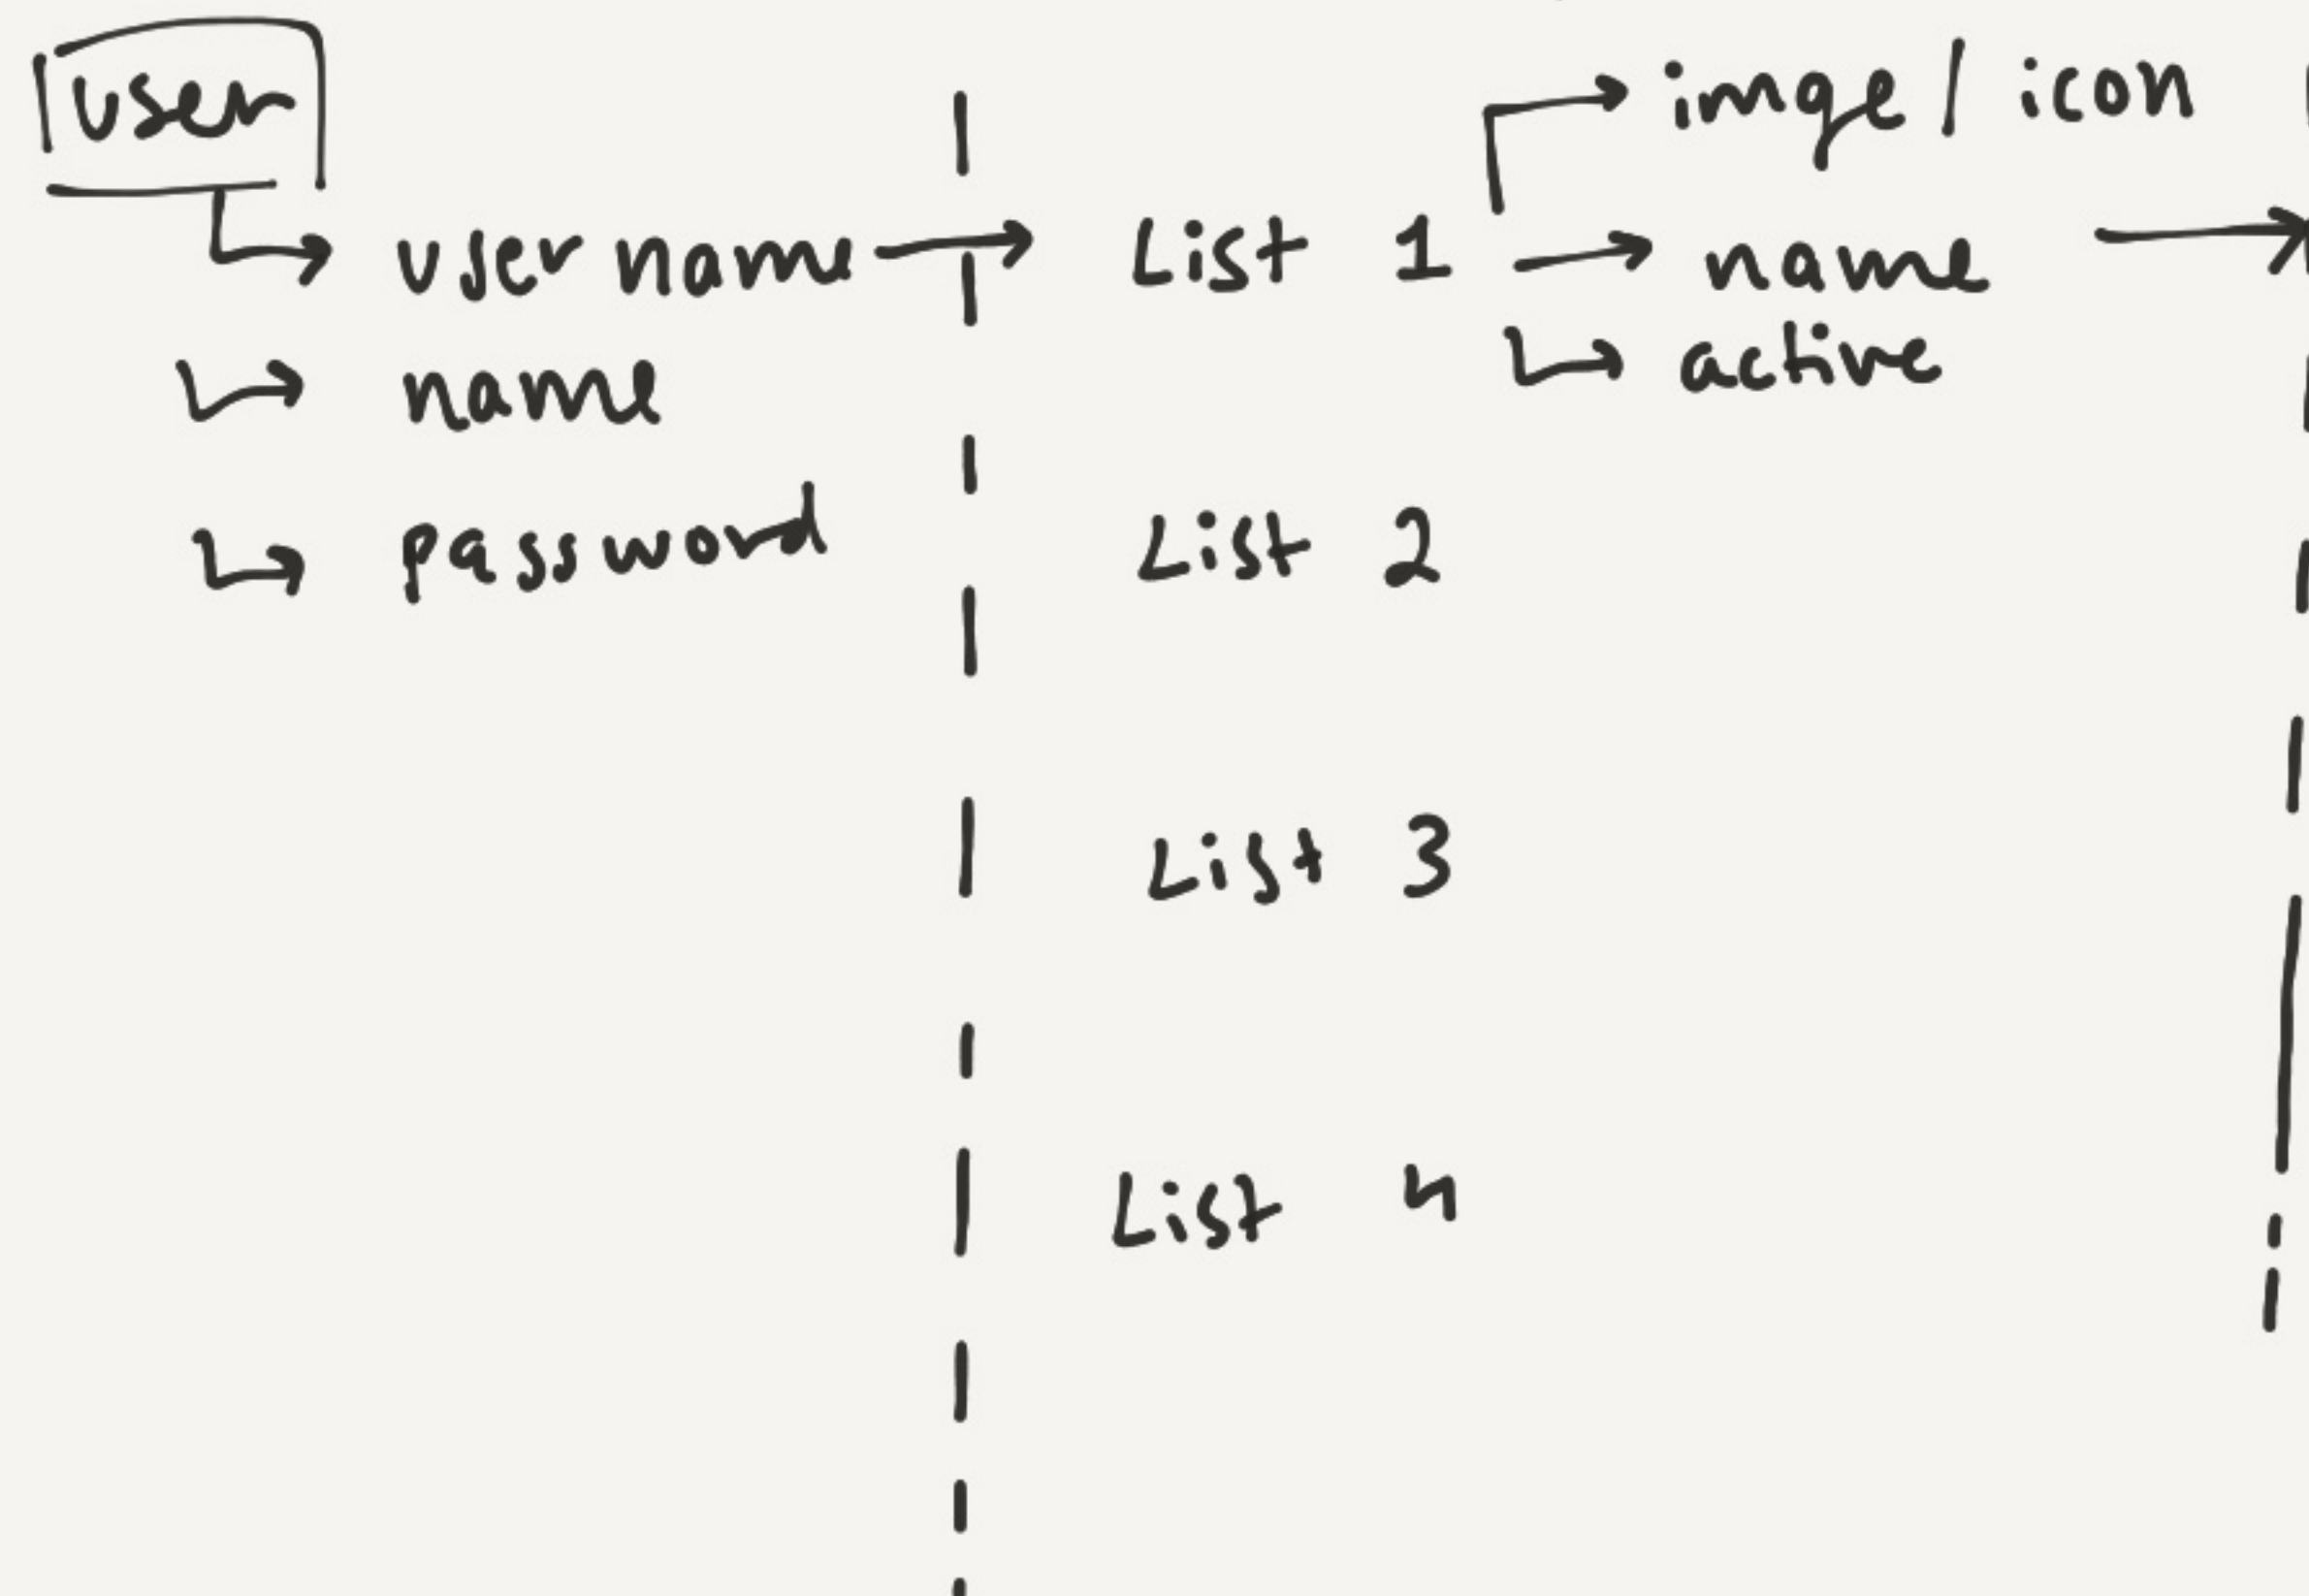

Q: how to figure out what the active list is?

mobile interfaces

1 item at a time

## overall structure (for data)

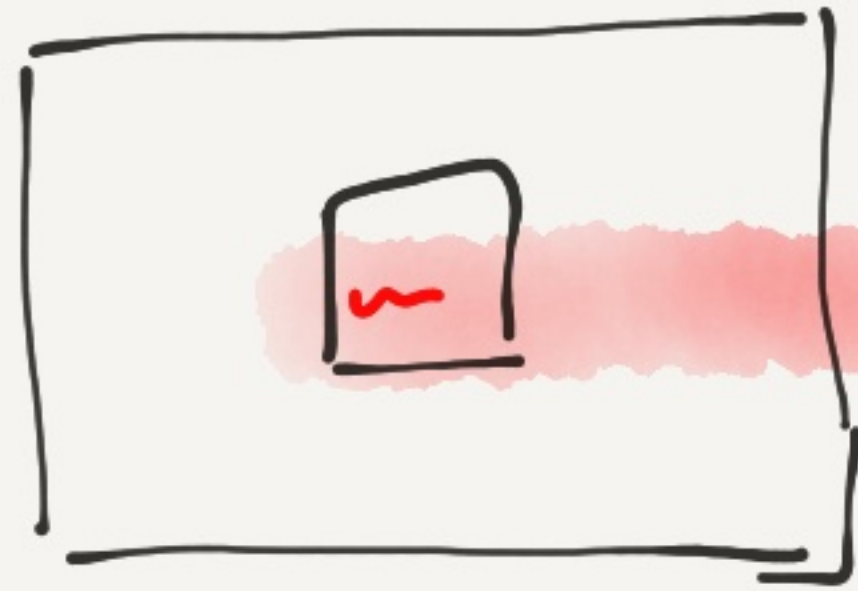

☒ make popup to edit/delete item

☒ edit | delete list popup  
 ↳ need to add icons  
 ↳ appear when hover

	expanded	hover	show(?)
T	T	T	T
F	F	F	F
T	T	F	F
F	F	T	F

login / sign up page

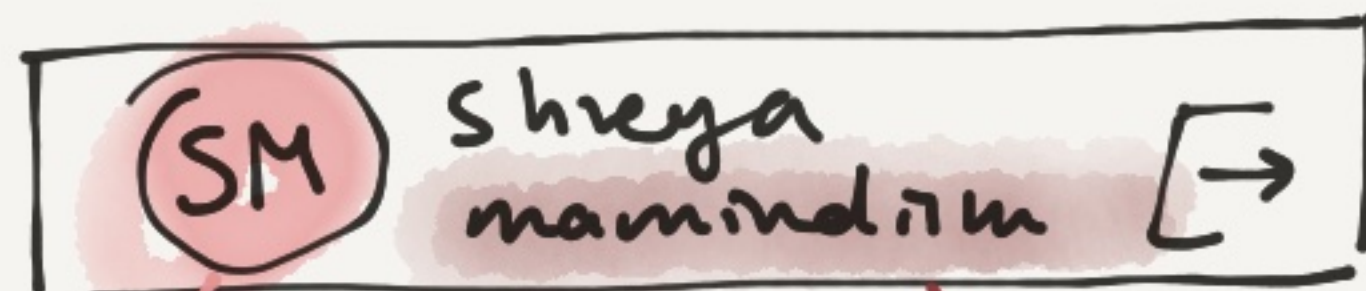

for error: once clicked on the text box, it should go away

note:

Q: • how do I change the tab depending on the active list (?)

profile information

make a function in helper JS to get initials of the name

figure a way to scroll when it goes out of bounds / instead of truncating

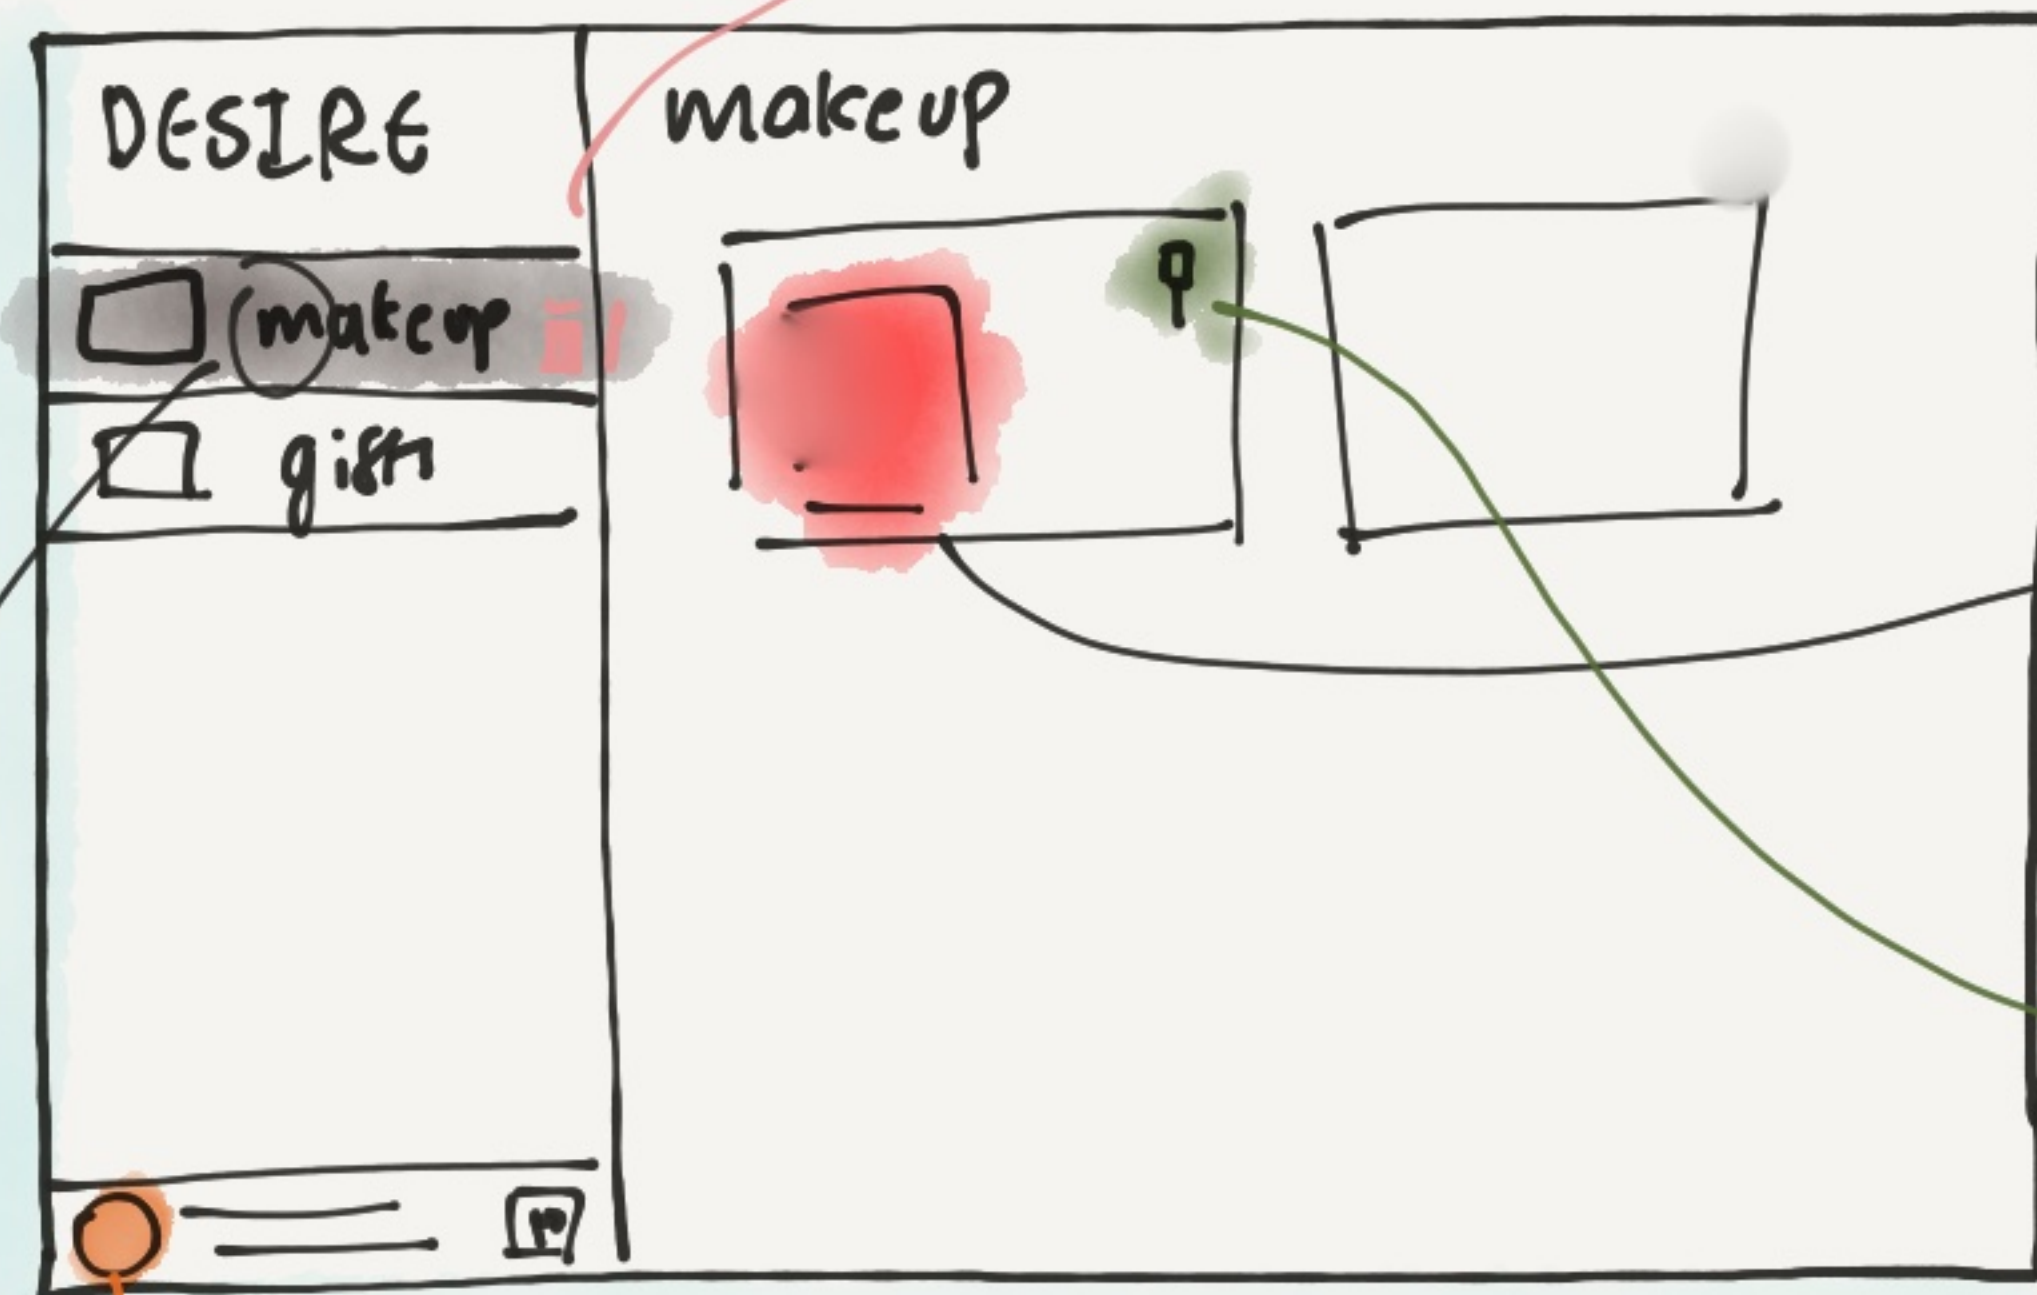

Responsiveness

→ fix overflow text for different displays

features to implement

→ on hover: should be able to edit/delete list.

→ how to integrate pictures?

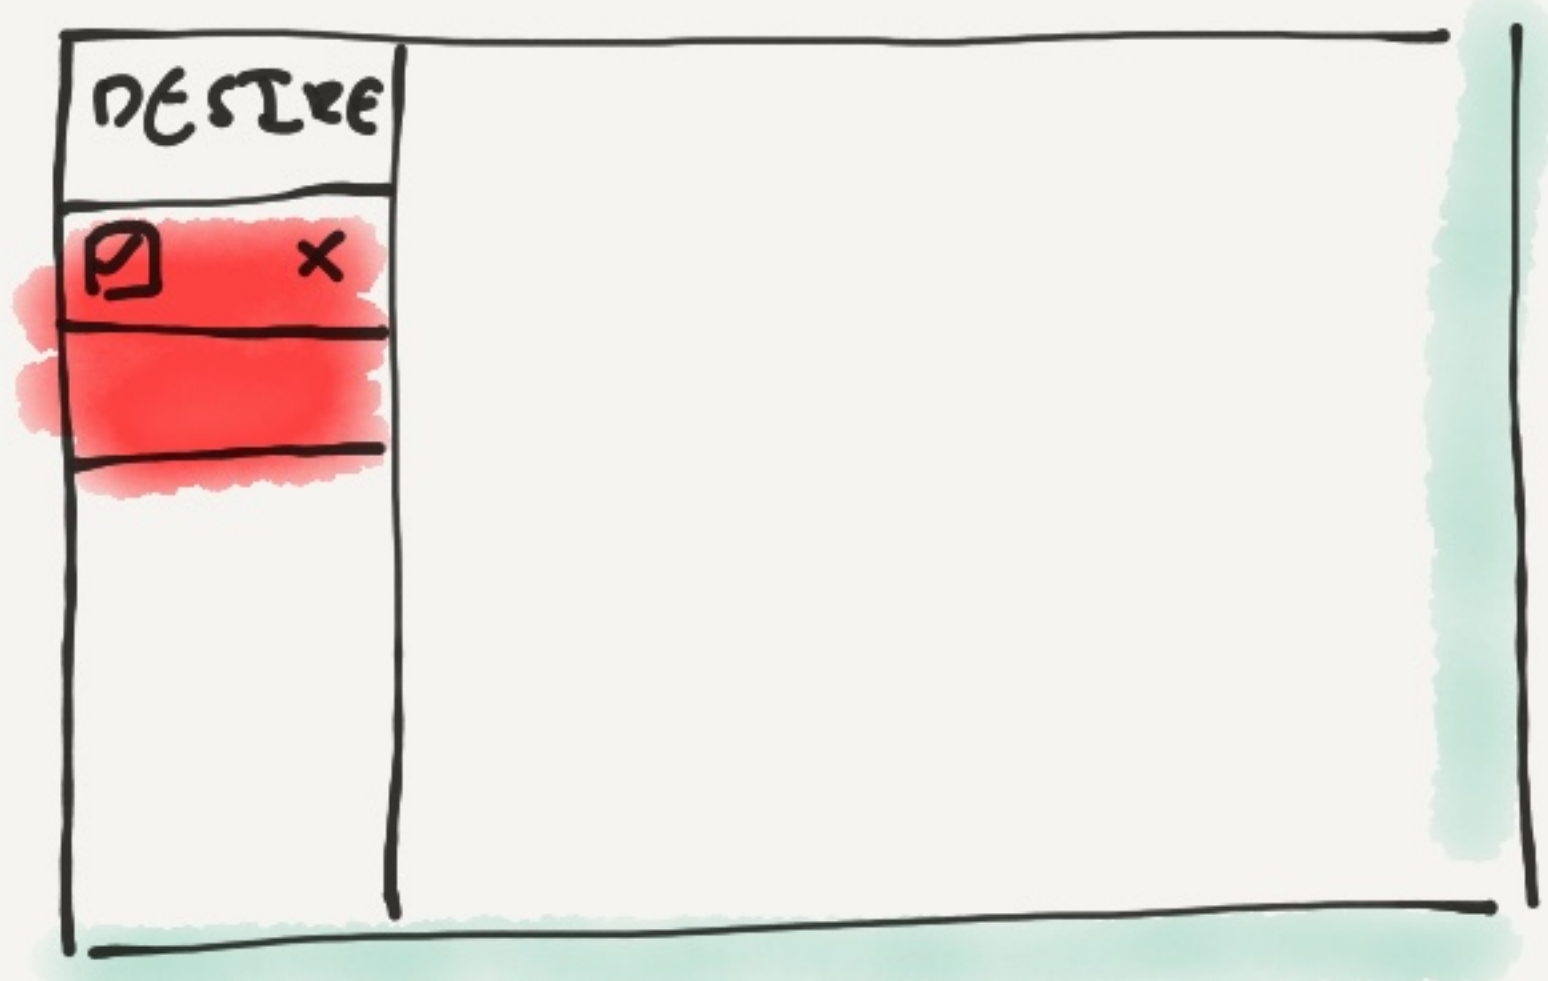

→ make sure it's pinned (outline colour changes)

on hover: [icon] option to delete account

for the aesthetic, make the first letter capital, and everything else lowercase.

bug.

→ when list is on edit, but isn't selected anymore, the edit is still on!

## Backend API calls

① How will I know which list the user clicked and what items to show?

- user clicks on list: capture listId
- send API request with listId.

② If I add an item in a certain list, how will the API know which list to add it to?
